1. 单链表的建立:

RESULT:

```
Section 1. The second section 1. The second
```

```
int data;
Node *next;
1 * @param head 链表头结点
3 void traverseLinkedList(Node *head)
       Node *current = head;
while (current != nullptr) // 当前结点非空
              std::cout << current->data << " ";
current = current->next;
9 int calculateLinkedListLength(Node *head)
       int length = 0;
Node *current = head;
while (current != nullptr)
              length++; // 长度自增
current = current->next; // 指针指向下一个结点
       Node *current = head;
while (current != nullptr)
              Node *temp = current;
current = current->next; // 指针指向下一个结点
delete temp;
 int main()
        Node *head = nullptr;
       // 建立一个单链表
Node *node1 = new Node;
node1->data = 1;
node1->next = nullptr;
head = node1;
       Node *node2 = new Node;
node2->data = 2;
node2->next = nullptr;
node1->next = node2;
        node3 = new Node;
node3->data = 3;
node3->next = nullptr;
node2->next = node3;
        std::cout << "Traverse the linked list:" << std::endl; // 第一次遍历 traverseLinkedList(head);
        // 计算链表的长度
int length = calculateLinkedListLength(head);
std::cout << "Length of the linked list: " << length << std::endl;
        deleteLinkedList(head);
        std::cout << "Traverse the linked list:" << std::endl; // 删除所有结点后遍历traverseLinkedList(head);
        int length1 = calculateLinkedListLength(head);
std::cout << "Length of the linked list: " << length1 << std::endl;
return 0;
```

2. 单链表的插入:

RESULT:

3. 单链表的删除:

RESULT:

```
Node *newhode = new Node();
newhode-vdata = value; // 非常节点的表现线板图为yelue
newhode-vnext = head; // 非常节点的next指针面内原来的头节点
head = newhode
// White new # printf(Towers the linked list:\n"); traveries thinkedlist(head); printf(Tolets an element to the header of the continuation(thead); // White is a significant traverses inkediast(head); traverses inkediast(head);
```

4. 单链表的查找:

RESULT:

```
The state of the s
```

5. 树的操作与处理:

RESULT:

```
TreeNode *newNode = new TreeNode();
if (newNode)
{
             newNode->data = data;
newNode->left = newNode->right = nullptr;
oid createLink(TreeNode *parent, TreeNode *leftChild, TreeNode *rightChild)
            result.push_back(root->data);
preorderTraversal(root->left, result);
preorderTraversal(root->right, result);
             inorderTraversal(root->left, result);
result.push_back(root->data);
inorderTraversal(root->right, result);
     createLink(root, node2, node3);
createLink(node2, node4, node5);
createLink(node3, nullptr, node6);
createLink(node5, node7, node8);
   // 前序题历
std::vectorsint> preorderResult;
preorderTraversal(root, preorderResult);
std::cout << "前序题历故思";
for (int num : preorderResult) {
    // 中环道历
std::vectordint> inorderResult;
inorderTraversal(root, inorderResult);
std::cout << "中坪姆历前果。";
for (int num : inorderResult)
f
   // 結译期所
std:vectorcimts postorderResult;
postorderTraversal(root, postorderResult);
std:rcout << 斯泽斯伊斯里。;
for (int num : postorderResult)
{
std:rcout << num << " ";
```
